November 24, 2009
Marina G. Morris, M.D., Medical Director, Chrisal, Ltd.

Dear Dr. Morris,

I am doing a final review of all the environmental services projects here at the hospital and felt compelled to write you about our testing and use of the probiotic solutions from Chrisal to control, clean and protect our facility's environment.

It was in April of 2008 that we first started testing and using Chrisal and I want to commend you for your efforts and Chrisal for its products that really do reduce nosocomial infections.

I know we gave you and your team a difficult time when you first presented the concept of using Chrisal's probiotics "because they will actually clean all the way down to the microscopic level". It was hard to believe this break-through worked. At the time I stated that I had heard thousands of claims of pathogen prevention cleaning, but never a solution that worked. Therefore, when we decided to test your Chrisal solution, I instructed my staff to give an extra thorough cleaning to the nine areas we selected to test Chrisal so that the pre-testing with our products would be even more difficult to match or beat with your products.

I have to admit that we were all astounded with the initial results that demonstrated two things: (a) that medical facilities should do routine, economical, monthly cultures of key areas and (b) that your product's initial testing beat all expectations. Since that time, in every case we tested and used them, Chrisal's cleaners worked remarkably and lowered pathogen counts to minimal levels.

What especially impressed all of us was the time a disinfectant was mistakenly used instead of Chrisal, resulting in a spike of staphylococcus. All of us, including a number of the respiratory therapists and the head of the infectious control department, were so impressed with what we saw on every test, that we then felt more comfortable using Chrisal than any other products, including for home use. The Allergy Free spray was especially effective.

All the testing and use of the Chrisal PIP products proved that they are an effective, economical and easy to use weapon in reducing hospital acquired infections as well as provide far better cleaning and odor control. Therefore, they are definitely beneficial to medical facilities and it was also obvious that Chrisal would be of major help in homecare.

So please keep me informed of all the new data on Chrisal and its applications. I feel an obligation to help disseminate information on Chrisal's probiotics because our study showed that its use could avoid millions of infections per year with the corresponding savings of billions of dollars for our country.

Sincerely,

Neil Caseiro, Director
Environmental Services
